Createspace. Paperback. Book Condition: New. This item is printed on demand. Paperback. 56 pages. Dimensions: 11.0in. x 8.5in. x 0.1in. Gender inequalities in life expectancy provide a broader picture by combining two sets of statistical measures: the usual static gap at a given point in time and the innovative S-time-distance measure as the gap in time for a given level of the indicator. Firstly, this offers an innovative approach for looking at disparities over many units and over time. The new S-time-distance measure, expressed in time units, is easy to understand by everybody and offers a novel way to compare situations in economics, politics, business, and statistics. Secondly, while women expect to live longer than men for 99.5 percent of the world population, the empirical results show astonishing differences among countries in gender disparity in life expectancy around the globe. Firstly, gender disparities in life expectancy analysed in Gaptimer Report No. 2 How much longer live women than men around the globe uses the theoretical concept of time distance dimension of inequality. This provides two innovative generic statistical measures S-time-distance and S-time-step to complement (not replace) the existing mostly static measures of inequality in many fields. This is an additional dimension to assess the reality that disparities can be very persuasive and a long-standing phenomenon. As Sicherl (1973, 1993) proposes observed time distance is a dynamic measure of temporal disparity between the two series intuitively clear, readily measurable, and in transparent units. It is suggested that one should complement conventional measures with horizontal measures. (Granger and Jeon, 1997) C. W. J. Granger and Y. Jeon, University of California at San Diego The time distance measure shows the reality with new eyes. The overall life expectancy the static difference between China and Sweden was less than 10 percent (which may appear...
